

Comprehension Check

In this section, you will be applying what you learned. Choose the best answer.

Atomic tests are focused on testing one specific part of the software

- True
- False

Atomic tests are quick and focused

- True
- False

Atomic tests ensure that each component works right before putting them all together

- True
- False

Atomic tests are complex to set up and maintain

- True
- False

Atomic tests promote modular design and ensure components work independently

- True
- False

Which of the following is a benefit of independent tests?

- They increase the complexity of the testing process.
- They make debugging and troubleshooting easier.
- They rely on other tests and external dependencies.
- They reduce test coverage.

7. Which of the following statements is true about autonomous tests?

- Autonomous tests require external dependencies to function properly.
- Autonomous tests are only used for unit testing.
- Autonomous tests make debugging and troubleshooting more challenging.
- Autonomous tests can be run simultaneously without conflicts.

8. Why is it important to separate setup and teardown steps from the test itself?

- It reduces the execution time of the test.
- It ensures that teardown will be executed regardless of test results
- It ensures that the test passes without any issues.
- It eliminates the need for setup and teardown in testing.

9. What is the purpose of the teardown step in testing?

- To initialize objects and test data before the test.
- To clean up resources and restore the environment after the test.
- To execute assertions and verify the expected outcomes.
- To define the specific behavior or functionality being tested.
